

Drupal- Remote Code Execution Vulnerability

Drupal is popular, free and open-source content management software (CMS), it is also a platform for web content management among global enterprises, governments, higher education institutions, and NGOs. Flexible and highly scalable. Drupal security team have now released a critical update to address an unauthenticated remote code execution vulnerability in Drupal and warns websites users to update CMS.

How it works:

A remote code execution vulnerability which allows attackers to exploit attack and take control of a web server. This bug is due to some file types not properly sanitizing data from non-form sources, such as RESTful web services. This failing can lead to arbitrary PHP code execution.

What to do:

- 1) If you are using Drupal 8.6.x, upgrade to Drupal 8.6.10.
- 2) If you are using Drupal 8.5.x or earlier, upgrade to Drupal 8.5.11.
- 3) Be sure to install any available security updates for contributed projects after updating Drupal core.
- 4) No core update is required for Drupal 7, but several Drupal 7 contributed modules do require updates.
